

Three laws your measurements already obey

RECIPROCITY

$$S_{12} = S_{21}$$

It passes a signal equally well in either direction.

BUILT IN.
Six outputs, not nine.

PASSIVITY

$$\text{out} \leq \text{in}$$

It cannot emit more energy than it receives.

CHECKED, NOT FORCED.
Never once broken.

SMOOTHNESS

one resonance

Behaviour changes gradually across the frequency band.

WHY 60 EXAMPLES
are enough to learn from.
